# Milestone Decision Outcome

**Milestone 1 — Empathize**

The target user was defined as an urban wellness professional living in a fast-paced city environment who seeks small moments of slowing down and mental balance within daily intensity.

It became clear that the user is not only looking for an energy-giving beverage, but also for a short daily ritual that creates a mental transition and moment of pause.

**Milestone 2 — Define**

The core problem was defined as the gap between speed-driven modern urban life and the human need for intentional ritual and slowing down.

Traditional matcha rituals hold strong meaning but are time-demanding, while modern beverage machines prioritize efficiency and eliminate the experiential ritual dimension.

**Milestone 3 — Ideate**

The project direction focused on designing an experience that adapts matcha philosophy to contemporary urban life while preserving the meaning of ritual.

Instead of full automation, a controlled semi-automated preparation system was proposed to balance practicality with an engaging ritual process.

**Milestone 4 — Prototype**

To design a system that transforms matcha preparation into a 3–5 minute intentional ritual, integrating both functional interaction and sensory experience.

A concept was developed that combines modern product aesthetics with elements of traditional ritual, allowing the user to both prepare and learn the process.

**Milestone 5 — Test**

To evaluate whether the design successfully balances ritual experience and practicality within a fast-paced urban lifestyle.

User testing focuses on understanding whether the product creates a short moment of mental transition, focus, and mindful engagement within everyday routines.
