IDEXAI Design Milestones

From Concept to Creation

Zeynep Vural S033761

Phase 1: Empathize & Define

Key Decision: Pivoting from a standard "kettle" to an "Anti-Stress Ritual Station" by integrating a built-in scale and PID heat stabilization.

Key Prompt: "The scale of this product eliminates the portion stress... it can scale the grammage of the tea and its screen shows the temperature."

Role of AI: Re-framer- It shifted the technical requirement of "weighing" into a user benefit of "eliminating portion stress

I will design for tea lovers aged 20-35 who enjoy drinking herbal tea, by focusing on ease of preparation, easy cleaning, and maintaining a constant temperature. Because it causes to prevent users brew fresh herbal tea and force them to teabags even though they would like to brew.

In this phase, I used AI as a tool to visualize my thoughts, to see more clearly what was coming to mind before producing something with a sketch.

Selected Concept

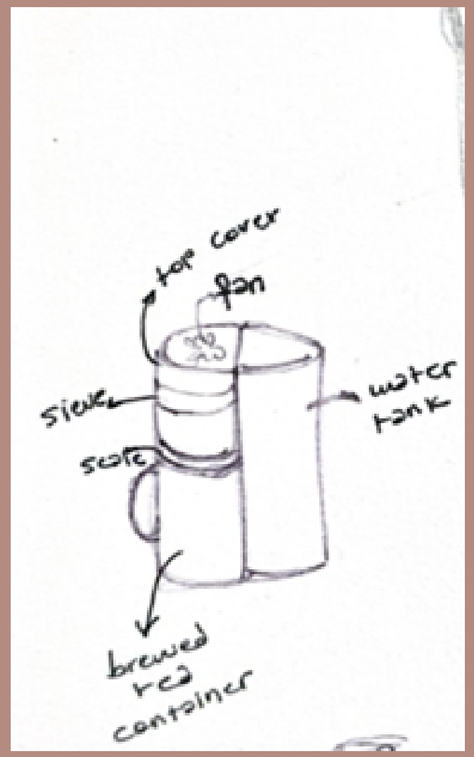
Concept 3: Unique Brew
This concept aims for a seamless, enjoyable, easy, and effortless user experience that users will want to use again and again, almost as simple as brewing a tea bag.
Interaction Strategy: In this strategy, users will engage in both physical and digital interactions, thus preventing interruptions in the experience.
Anti-Stress Strategy: This strategy focuses on easy cleaning and maintaining a constant temperature. This ensures the relaxation of the highest tension points and improves the experience.
Habit Strategy: This involves acquiring a new habit or regaining an existing one

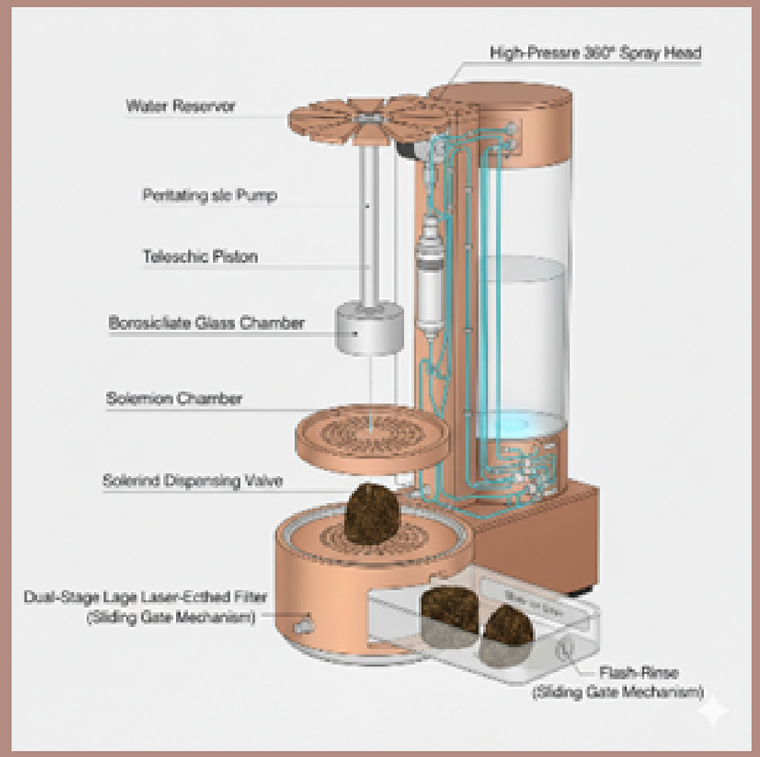
Phase 2: Ideation & Critique

Key Decision: To create a self-cleaning, portion-controlled product

Key Prompt: “ How can I start and how can I carry out this cleaning process?”

Role of AI: Critique- It identified a critical failure in early renders: the lack of a physical scale gap, which would make the weighing function impossible.



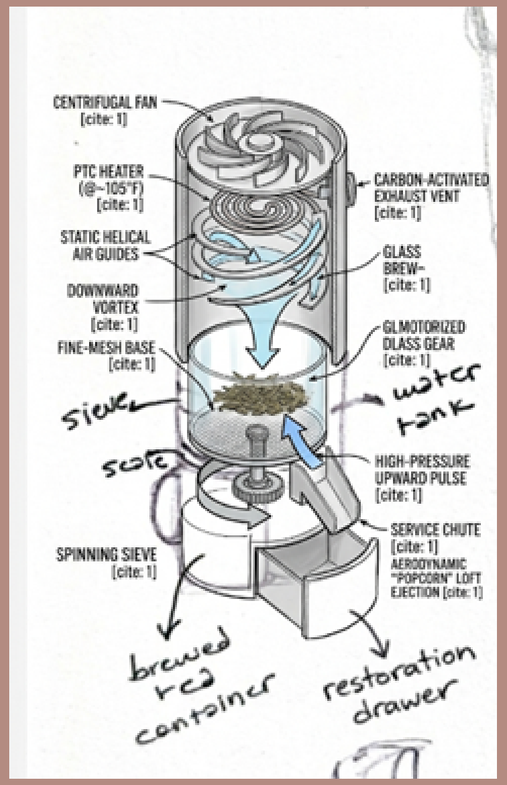


Phase 3: Prototyping & Sensory Engineering

Key Decision: The idea of cleaning was abandoned and the focus shifted to keeping the tea hot.

Key Prompt: Now let's forget about the self-cleaning idea and focus on how to keep the tea hot in this system. How do you think I can implement this in these models?

Role of AI: Expander-It gave ideas, and then, not stopping there, it expanded the process by providing different examples that could improve the design, thus improving the product.

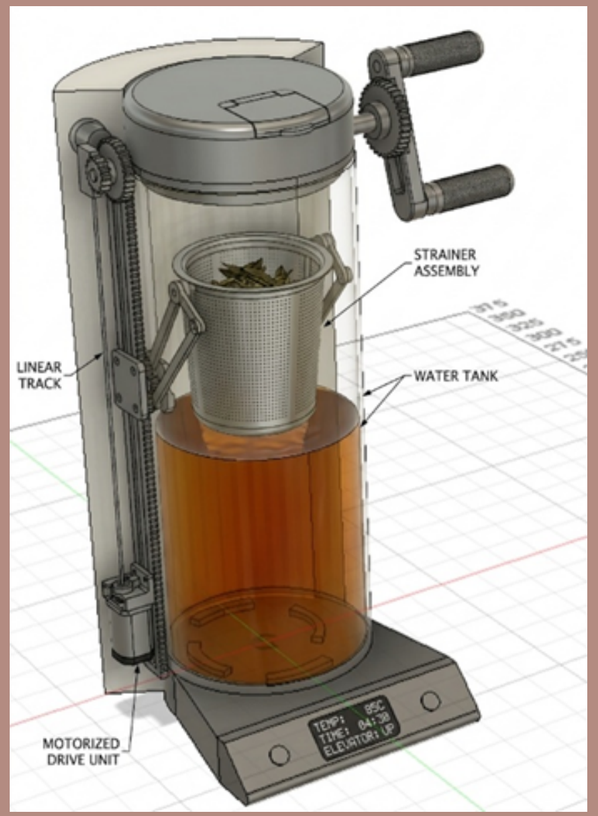


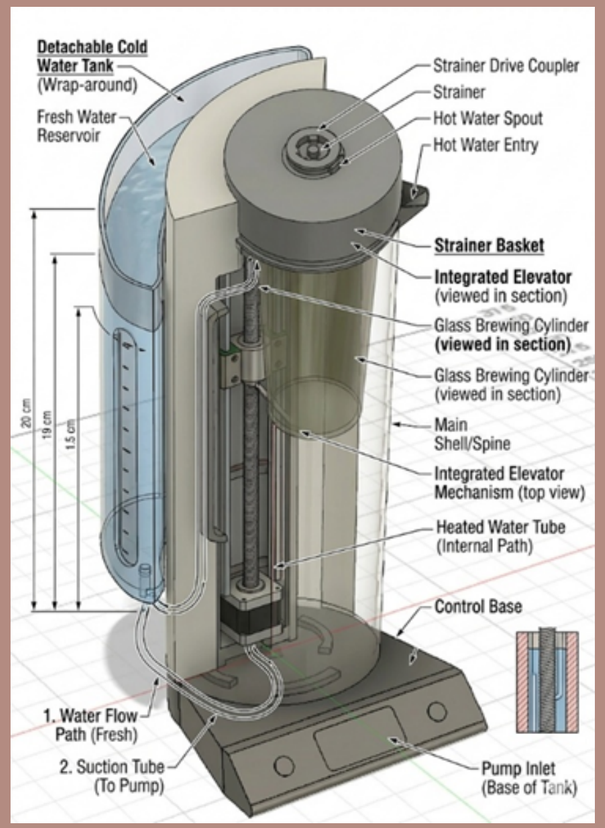
Phase 4: Final Refinement & Architecture

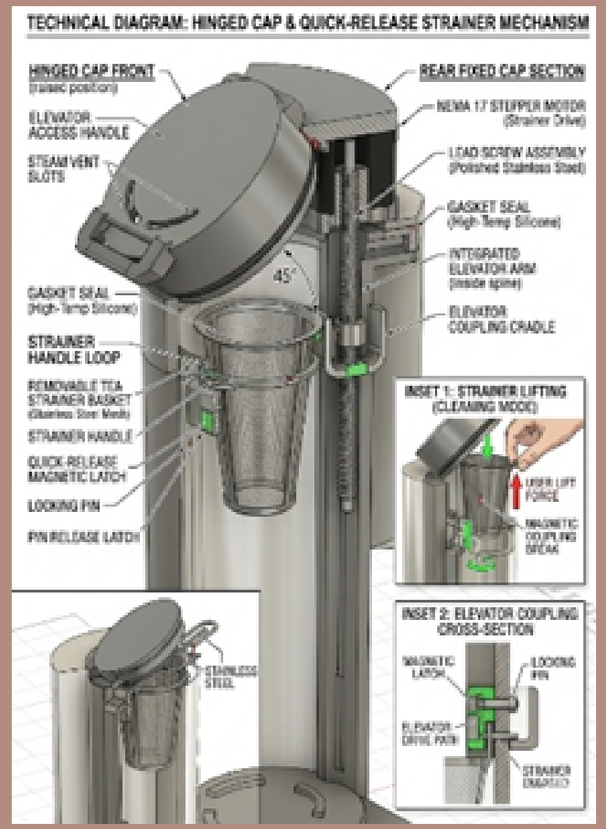
Key Decision: Enabling the filter to move back and forth on an elevator and transforming the interface into a wellness experience.

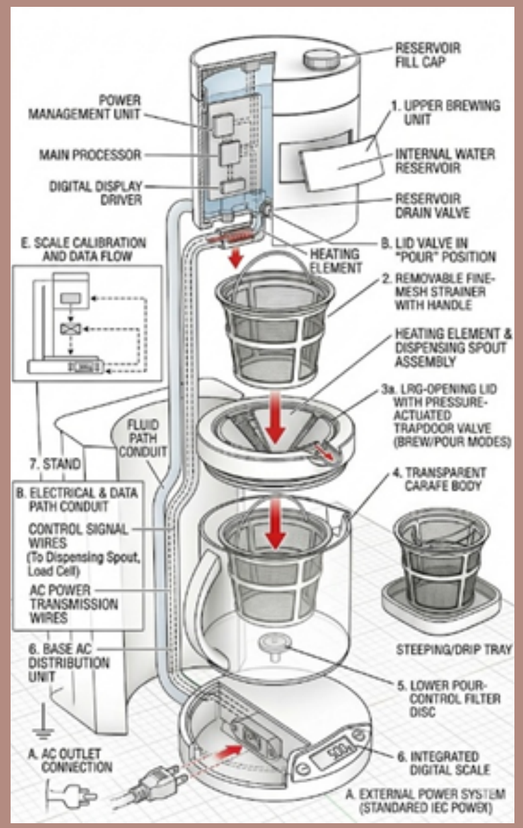
Key Prompt: “To complete this system, I need to upgrade the elevator system. How can I do that?”

Role of AI: Clarifier–It clarified the design process by explaining how the system would be assembled and what would be best placed where.









Final Design Decision and Implementation
