Design Milestones

Telvora is a shared-oriented meeting point that brings the traditional Turkish coffee ritual together in a circular orbit for modern office environments.

EMPATHIZE

USER INSIGHT

Coffee machines located in shared environments such as offices, break areas, and common meeting points are frequently used throughout the day. Users usually want to prepare coffee quickly during short breaks. Therefore, speed, ease of use, and consistent coffee quality are important expectations for users.

USER PROBLEMS

The machine can produce only a limited number of coffees at the same time, which can create waiting lines in busy environments.
Inconsistency in coffee taste and foam quality can negatively affect the user experience.
Unclear sugar settings may cause incorrect sugar levels and lead to unnecessary waste.

KEYWORDS

Shared space • Break area • Meeting point • Ease of use • Speed • No waiting / Queue reduction • Consistent coffee quality • User experience

AI ROLE

Clarifier

AI PROMPT

"What are common user expectations and problems with coffee machines in shared environments?"

AI RESPONSE

Users expect coffee machines to be fast, easy to use, and reliable. However, common issues include waiting in line, inconsistent coffee quality, and confusing interface settings.

DESIGN DECISION

Focus on improving ease of use, speed, and consistency in the coffee preparation process to enhance the overall user experience in shared environments.

EMPATHIZE

I conducted interviews with four different office employees. Based on the insights from these interviews and my online research, I collected visual references of office kitchen areas and break spaces.

DEFINE

USER INSIGHT

In shared environments such as offices and break areas, coffee machines are used by many people throughout the day. Users expect a fast, simple, and reliable coffee preparation experience. However, current machines often fail to meet these expectations due to capacity limitations and confusing settings.

PROBLEM STATEMENT

Users in shared spaces need a coffee machine that can prepare coffee quickly, maintain consistent taste and foam quality, and provide clear control options without creating confusion or waste.

KEYWORDS

Efficiency • Consistency • Capacity • Clear interface • Sugar control • User experience

AI ROLE

Re-framer

AI PROMPT

"How can the problem of waiting time, inconsistent coffee quality, and confusing settings in shared coffee machines be defined as a clear design problem?"

AI RESPONSE

The main challenge is designing a coffee machine system that balances speed, clarity, and consistency while supporting multiple users in shared environments.

DESIGN DECISION

Focus the design on:

Improving coffee production efficiency

Ensuring consistent taste and foam quality

Creating a clear and intuitive interface for sugar and coffee settings

TRANSFORMATION

User Problems

↓

Design Focus

Limited coffee production → Improve capacity and efficiency

Inconsistent taste → Ensure stable coffee quality

Confusing sugar settings → Design a clearer interface

IDEATE

USER INSIGHT

In shared spaces, users want to prepare coffee quickly and conveniently. Clear settings and consistent coffee quality are also crucial for a positive user experience. Additionally, Turkish coffee carries a cultural and social value, encouraging people to gather, take a break, and enjoy conversation in a circular, communal setting.

IDEA GENERATION

To address these problems, various design ideas and solutions were considered:

Develop a system capable of preparing multiple coffees simultaneously

Organize water, coffee, and sugar containers in a more accessible and orderly way

Make sugar settings more understandable and controllable

Design a simple interface that allows users to select settings quickly

Create a design that encourages social interaction, with a circular or communal layout that invites users to gather and enjoy coffee together

KEYWORDS

Idea generation

Alternative solutions

User-centered design

Simple interface

Efficient system

Social interaction

(AI helped generate new ideas and alternative solutions.)

AI PROMPT

“What design ideas could be developed to solve problems such as waiting in line, complex settings, inconsistent coffee quality, and lack of social interaction in shared coffee machines?”

AI RESPONSE

AI suggested ideas such as a more efficient coffee preparation system, a clearer interface, better organized components, and a layout that supports social interaction.

DESIGN DECISION

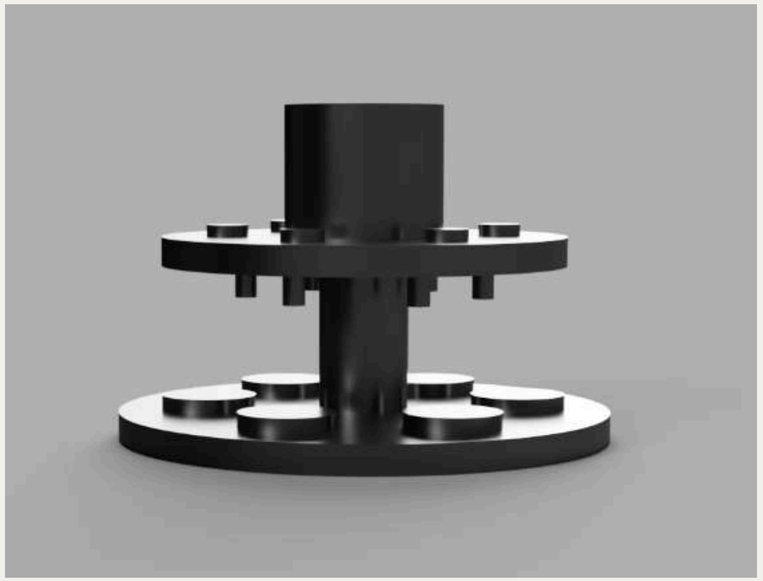
Focus on a system that speeds up coffee preparation

Develop a simple interface that users can easily understand

Organize water, coffee, and sugar containers more efficiently

Incorporate a circular or communal design that promotes social breaks and conversation

IDEATE



In this stage, I created my first concept models to explore the form of the coffee machine, the placement of the containers, and the interaction with the user. Through quick sketches and visualizations, I investigated how the water, coffee, and sugar containers could be positioned inside the machine while keeping them easily accessible in shared spaces.

I also experimented with different form alternatives and focused on a circular structure. I thought that a circular form could encourage users to gather around the machine and support the social and break culture that comes with Turkish coffee. These early models became a starting point for developing the container placement, interface layout, and overall form language of the design.

PROTOTYPE

Key Design Milestones / Process Visualization
Creating refined visual concepts using sketches and Vizcom renderings
Clarifying the placement of water, coffee, and sugar containers
Developing and testing the circular form for user interaction in shared spaces
Producing more advanced visual prototypes to evaluate the overall design
Keywords
Visualization
Interface design
User experience
Shared space interaction
Social break culture
Selected Impactful Prompts
“How can the prototype stage of a Turkish coffee machine for shared office spaces improve user experience?”
“How should container placement and interface design be organized so users can prepare coffee quickly and easily?”

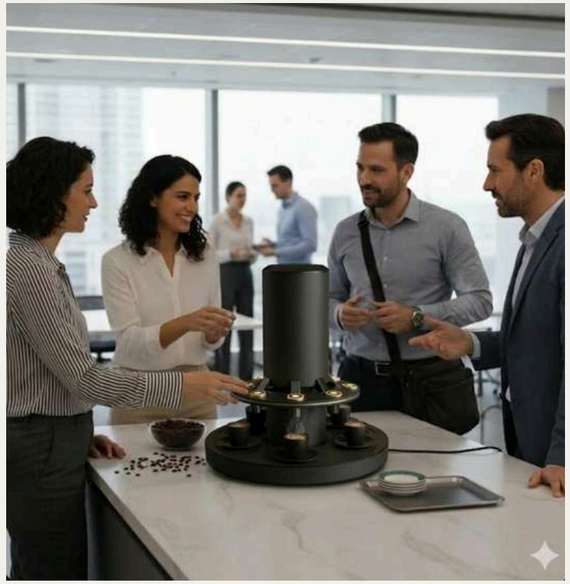
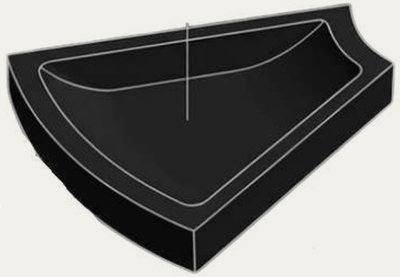
Critique
AI Response Summaries
AI suggested focusing on improving usability through clearer container placement and a simpler interface.
It highlighted the importance of a design that allows multiple users to interact with the machine easily.
AI also supported the idea that a circular form could encourage social interaction in shared spaces.
Your Reflections
At the prototype stage, my ideas became more concrete and easier to evaluate visually.
The visual prototypes helped me better understand the proportions and structure of the machine.
Testing different interface arrangements allowed me to see which design felt more intuitive for users.
Your Design Decisions
Improve the accessibility and organization of the containers
Develop a simple and understandable interface
Strengthen the circular form to support social interaction in shared office environments
What I Accepted, Rejected, and Transformed
Accepted: The circular form concept that supports social interaction around the machine
Rejected: Complex interface layouts with too many options
Transformed: The placement of containers and interface elements to make the system more user-friendly and efficient



DETAILS

This is a flip-open cover, and the containers are located here. When a container is empty, the user can remove it, refill it, and place it back.

The place where the sugar level is set.



These are the removable trays at the bottom. When the coffee flows down from the grate, the user can take out the tray, wash it, and put it back.

User Scenario: Office Coffee Break

Social Gathering: Berna and her colleagues gather around the circular machine. Its form encourages face-to-face interaction while allowing multiple users to prepare coffee simultaneously.
Power On: A team member presses the central Power button. The circular light ring activates, signaling the machine is ready.
Station Activation: Berna focuses on the cup-icon button at her station. A single tap activates her brewing unit.
Sugar Selection (Tap to Scroll): Berna taps the same button repeatedly to cycle through sugar options. With each tap, the light segment "slides" along the arc to the next sugar level (e.g., No Sugar, Low, Medium, High).
Confirmation (Long Press): Once she reaches her desired sugar level, Berna long-presses the button to confirm. This locks her choice and initiates the brewing process.
Seamless Flow: Fresh Turkish coffee begins to pour into her cup. Her friends perform the same steps at their own stations, enjoying a synchronized coffee experience without waiting in line.
