GENERATIVE BRAINSTORMING

KEY PROMPT

How do evening wind-down tea rituals differ functionally from morning pre-work rushes in terms of preparation habits and attention to detail?

AI ANSWER

While morning tea preparation is a fast, automated rush prioritizing utility with minimal attention to detail, evening rituals are deliberate practices where the slow brewing itself serves as a mindful transition into relaxation.

STUDENT REFLECTION

I realised that while making an automated tea maker, I could accidentally get rid of some aspects of the said relaxing brewing process.

DESIGN DECISIONS

ACCEPTED

The design will try to get the best of both worlds. Tactility and automation.

REJECTED

A suggestion about automating the clean-up process afterwards was rejected as it is not in the scope of the project at the moment.

TRANSFORMED

The decision is to have the user interact more than just pressing a single button.

AI Role: Expander

GENERATIVE BRAINSTORMING

KEY PROMPT

I am designing a hybrid electronic tea maker with two distinct modes. It has both tactile and automatic features built into a single body. Who is the ideal target user? Describe their lifestyle.

AI ANSWER

Your ideal target user is a time-pressed urban professional whose demanding lifestyle requires hands-free automation for rushed mornings, but who actively craves tactile, grounding rituals to decompress in the evenings.

STUDENT REFLECTION

I realised that a person requiring tea quickly in the morning could have a more individualistic consumption need.

DESIGN DECISIONS

ACCEPTED

People working 9-to-5, living a fast paced lifestyle in a small apartments are chosen as the designated persona.

REJECTED

AI overreacted a bit and proposed that the product should simply blend in with its environment so as to not attract any attention from the user.

TRANSFORMED

I will design for a 9-to-5er living in a small apartment, by focusing on the demand for rapid morning efficiency and the human desire for tactile, grounding rituals basically preventing any lifestyle erosion.

AI Role: Clarifier

GENERATIVE BRAINSTORMING

KEY PROMPT

Act as a Reframer. Using the POV statement generate 5 alternative problem framings: speed-first, safety-first, trust-first, ritual/comfort-first, and shared-space conflict-first.

AI ANSWER

The primary problem is a race against the clock. The morning routine is frantic that every second spent interacting with the machine is a second wasted. Getting the tea ready before as soon as possible is important.

STUDENT REFLECTION

The user should be able to make tea as soon as possible

DESIGN DECISIONS

ACCEPTED

The problem framings about speed is going to be focused on more compared to the rest.

REJECTED

I rejected the idea that evening decompression is the product's true purpose with morning efficiency treated as a secondary "hack," because our current strategy strictly requires prioritizing speed-first problem framings.

TRANSFORMED

Inspired by the English product “Teasmade”, I decided that an alarm feature that boils and pours water into a carafel would be a cool feature.

AI Role: Re-framer

GENERATIVE BRAINSTORMING

KEY PROMPT

At night, the user fills the water tank, places tea in the carafe, and sets an alarm. Just before waking, the system automatically boils and dispenses the water into the carafe. Act as a critic, identify overscope with reasoning.

AI ANSWER

By assuming the tea bag will remain static during the automated pour, the design overlooks how sudden water turbulence will inevitably drag the unsecured string and tag into the brew, making a physical anchoring feature absolutely essential during the evening prep.

STUDENT REFLECTION

I need to find a way to a physical way to prevent the tea bags from falling into the carafel when the user is sleeping etc.

DESIGN DECISIONS

ACCEPTED

Projections on top of the carafel can secure the string by preventing the tag of the bag from going in.

REJECTED

Move the tea bags towards the upper chamber, so that the user doesn't have to concern themselves with the tea bags is a needlessly difficult approach.

TRANSFORMED

Said projections should be placed near the handle, facing towards the user for easy access.

AI Role: Critic

GENERATIVE BRAINSTORMING

KEY PROMPT

Act as a critic. Is my product satisfying enough for an individual looking for a ritual-oriented tea making session in their leisure time?

AI ANSWER

Simply closing a lid with a hanging diffuser is too utilitarian and abrupt to provide a satisfying evening ritual, requiring an extra, deliberate tactile step to give the user a meaningful sense of engagement and control.

STUDENT REFLECTION

I realised that while I need to add a step, I need to make sure I am not making the whole process too cumbersome for the user to want to make tea themselves.

DESIGN DECISIONS

ACCEPTED

Add an extra gesture after placing the lid on the product having the tea basket as the main focus.

REJECTED

Placing the tea basket manually on the ground of the glass chamber is rejected because it would block the tunnel going towards the carafe at the bottom.

TRANSFORMED

A mechanism that drops the basket into the water when the user twists a knob like shape from above.

AI Role: Critic
