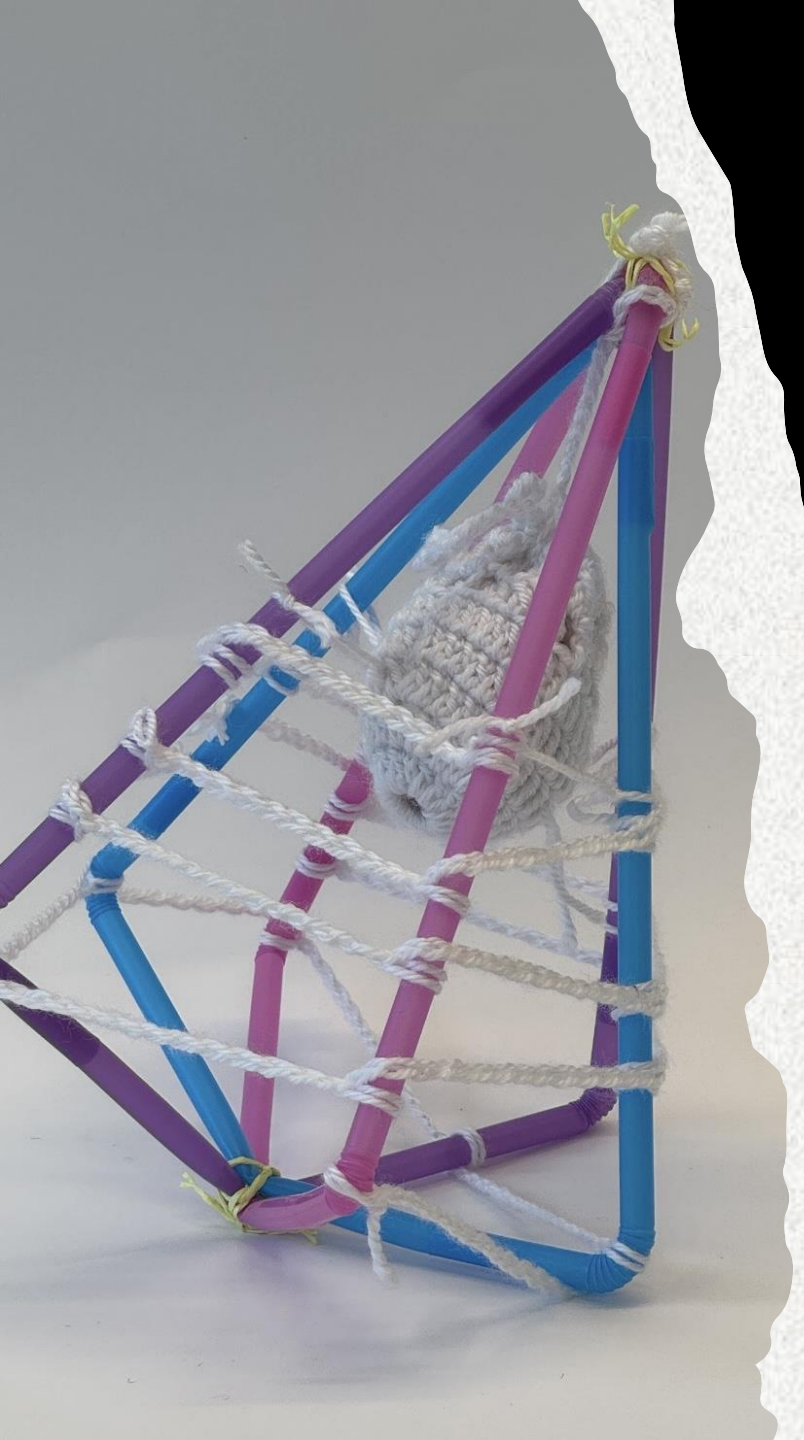
Design Milestones

Zeynep Baş



This to That

Selected Impactful Prompts

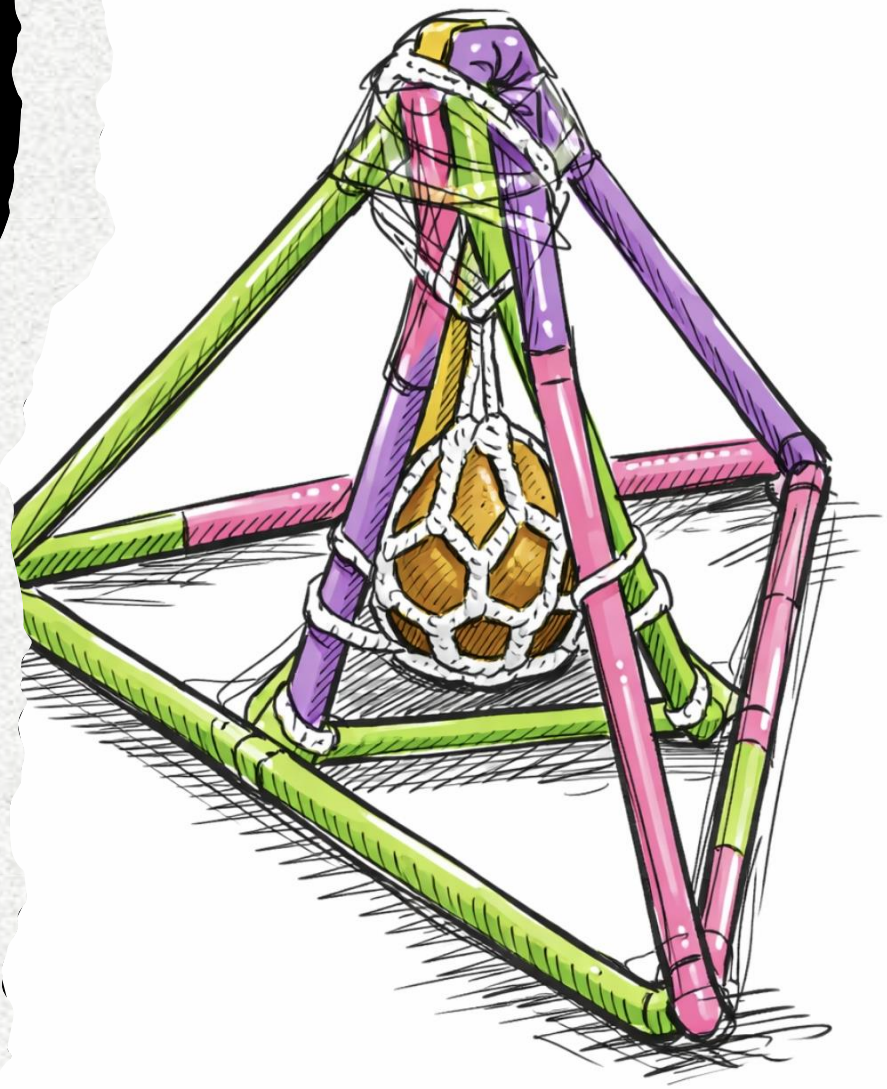
“How does force travel during impact?”

“Which structure is most stable without glue?”

“How can I absorb shock using only string?”

AI Responses

- Suggested using triangular geometry for stability.
- Recommended suspending the egg in the center.
- Emphasized energy distribution instead of impact blocking.
- Highlighted weak points like bottom joints.



My Reflections

- I realized that protecting the egg is not about making the structure hard, but about slowing down the force. Geometry and balance are more important than thickness. Thinking structurally changed how I approach design problems.

My Design Decisions

- ✓ Used triangles instead of square frames
- ✓ Kept straws short to prevent buckling
- ✓ Suspended the egg at the center
- ✓ Left space between egg and frame

In the end it failed
