Esma Ozbey

Design Milestones

IDE202.A X AI

Timeline

1- RESEARCH

I researched home coffee culture and coffee corners in modern kitchens.
I also analyzed existing espresso machines and how people use them at home.
Most of the user and market research was conducted independently.

2- IDEA GENERATION

I generated several design ideas for an espresso machine that fits small coffee corners.
The goal was to create a machine that is compact, aesthetic, and easy to use.

3- DEVELOPMENT

I selected the strongest concept and started refining the design.
AI tools were used mainly to visualize sketches and explore different visual directions.
I used Vizcom to transform my sketches into more polished visual representations.
This helped me better communicate the design idea.

4- FINAL DESIGN

The final design focuses on a compact espresso machine designed specifically for home coffee corners, combining functionality and modern aesthetics.

- Home Coffee Corner
- Espresso
- Compact Design
- User Experience
- Minimalism
- Functionality
- Modern Kitchen

Selected Impactful Prompts

Prompt

What components are inside an espresso machine and how are they typically arranged?

Why it was useful:

Helped me understand the internal structure of espresso machines and think about component placement in my design.

(Many visual prompts required several iterations because the generated images often did not match my intended design direction.)

AI Role Tags

Clarifier

AI helped clarify technical aspects of espresso machines, especially regarding internal components and how they function together.

Expander

AI expanded the project by helping develop a clear usage scenario, showing how a user would interact with the espresso machine.

Critique

AI provided suggestions and feedback on the organization of internal components and functionality, which helped evaluate possible design solutions.

AI Response Summary

AI helped analyze how internal components of an espresso machine could be arranged, such as the placement of the water tank, pump, and heating system.

It provided suggestions about efficient internal layout and component organization.

AI also assisted in developing a usage scenario to better explain how a user would interact with the espresso machine in a home coffee corner.

Reflections

Most of the design ideas and research were developed by me.
AI was mainly used as a support tool for visualization and idea exploration.
Using Vizcom allowed me to present my design ideas more clearly and professionally.

Design Desicions

I designed the machine as a three-function product that can grind coffee beans, brew espresso, and froth milk, allowing the user to prepare different coffee drinks with a single machine.
I integrated a digital interface that allows the user to adjust the grind size and the amount of ground coffee (grams). This provides more control over the espresso preparation process.
Since the product is intended for home coffee corners, I considered its social aspect as well. The machine is designed to function not only as a coffee-making tool but also as a visual centerpiece or show item when guests are present.
The width of the machine was designed to fit two espresso shot glasses at the same time, allowing the user to prepare two shots simultaneously.
I selected soft and neutral color options so the product can easily adapt to different home environments and user lifestyles, while maintaining a calm and modern aesthetic.

Accepted/ Rejected/ Transformed

Accepted

I accepted AI suggestions related to the usage scenario, as they helped structure how the user would interact with the espresso machine in a home coffee corner.

Rejected

I rejected most of the visual design suggestions generated by AI tools such as Gemini, because they did not match my design vision or the aesthetic direction of the project.

Transformed

I used Vizcom to visualize my sketches, but I further modified and refined the visuals to better match my intended design.

The AI-generated visuals were adapted and transformed to align with my concept.
