ARTISANAL CHADO

THE EVOLUTION OF A MESS-FREE MATCHA RITUAL

S040311

BERRA NUR KAZANCI

2026

DESIGN ORIGIN

Key Milestone: Initial concept focused on exposed mechanical movement.

AI Role: Critique (AI highlighted the manufacturing complexity of multi-gear systems).

Design Decision: * Accepted: The "pivoting lid" opening mechanism.
Rejected: The multi-gear assembly (Too complex, high failure risk).

Reflection: I realized that "visual complexity" doesn't always mean "good engineering." I needed a cleaner, more reliable power source.

TECHNICAL TRANSITION

Key Milestone: Shifting from a high-maintenance gear system to a Direct Drive Stepper Motor (NEMA 17).

AI Role: Clarifier & Expander (AI helped define the technical benefits of torque stability and RPM control).

Design Decision:
Accepted: High-torque direct drive system.
Rejected: Multi-gear assembly (due to noise, mechanical wear, and manufacturing complexity).

Reflection: Moving to a stepper motor was a turning point. It allowed for a more compact internal design while providing the exact torque needed for different matcha consistencies.

INITIAL AESTHETIC

Key Milestone: The first visual exploration using a 100% walnut wood body to mimic traditional Japanese tea cabinetry.

AI Role: Expander (AI helped generate a warm, organic feel that emphasized the spiritual side of the ritual).

Reflection: While the all-wood aesthetic was very warm and traditional, I realized it lacked the 'precision instrument' feel required for a motor-driven device. It felt more like furniture than a functional kitchen appliance.

Design Decision:
Accepted: The use of walnut wood as a core DNA of the brand.

Transformed: I decided to move away from a full-wood body to a hybrid design to better communicate the machine's power and technical accuracy.

QUICK-RELEASE & MESS-FREE LOGIC

Key Milestone: Integration of a "Quick-Release" coupling system that keeps the whisk inside the jar during and after removal.

AI Role: Re-framer & Problem Solver (AI helped visualize the mechanical 'engaged' vs 'disengaged' states).

Design Decision:
Accepted: A mechanical spline interface that allows the motor to "drop in" and "lift out" effortlessly.

Transformed: The whisk is no longer a part of the machine; it is now a module of the jar assembly.

Reflection: By keeping the wet whisk inside the jar, we eliminated the mess on the counter and the machine. It transformed the user experience into a clean, seamless ritual.

THE INTEGRATED ENGAGEMENT LOGIC

In this final iteration, the system operates through a dual-lid synchronization. The Chasen (bamboo whisk) and its drive arm are integrated into the jar’s own lid. When the jar is placed in the machine and the main machine lid is lowered, the stepper motor shaft automatically engages with the jar’s lid.

Design Decision (Accepted): A "Coupled Drive System" that separates the power source (motor) from the preparation module (jar/whisk).

AI Role: Clarifier & Re-framer.

Reflection: This design ensures that the machine remains 100% clean. By keeping the whisk and arm inside the jar's lid, we've eliminated the risk of matcha splashing onto the device or the countertop. It is a seamless transition from whisking to serving.The best engineering is often the removal of unnecessary parts. By aligning the motor shaft vertically with the jar lid, I eliminated the need for a release button, making the machine more intuitive and less prone to mechanical failure.

FINAL AESTHETIC SYNTHESIS – BRUSHED METAL & WALNUT HARMONY

Key Milestone: Elevating the visual identity by transitioning from a single-material look to a high-end Hybrid Material Finish.

AI Role: Expander & Style Refiner (AI helped define the "Industrial Zen" aesthetic, ensuring the transition from wood to metal felt balanced and intentional).

Design Decision:
Accepted: The dual-material approach (The contrast between the "cold" metal and "warm" wood).
Rejected: Full-plastic bodies or high-gloss finishes (which lacked the artisanal feel).

Reflection: The final renewal of the exterior was about 'Honesty of Materials.' By combining metal and wood, I created a machine that feels both technically advanced and spiritually connected to tea culture. It is a bridge between the 16th-century ritual and 21st-century engineering.

FINAL PRODUCT OVERVIEW

The final iteration of Artisanal Chado is a high-precision preparation station that seamlessly manages the delicate variables of the matcha ritual. To ensure the highest tea quality, the machine features an integrated heating system that maintains water at an optimal 80°C, paired with a discreet rear-mounted water reservoir to preserve the device's slim silhouette. User interaction is simplified through a dual-dose interface, allowing for a one-touch selection between 'Koicha' and 'Usucha' styles, which automatically calibrates the water-to-tea ratio. Powered by a silent NEMA 17 stepper motor, the system delivers consistent torque for perfect aeration. Every design choice, from the tactile physical buttonsto the automated whisk engagement, was made to balance modern convenience with the mindful, artisanal spirit of traditional tea culture."
