Impactful prompts & AI role tags

What are the most common problems users face during the preparation and consumption of hot beverages including issues related to taste, dosage, temperature, and preparation inconsistencies?

AI role: Clarifier

Which hot beverage category shows the greatest inconsistency at home in terms of taste and perceived effects?

AI role: Re-framer

What difficulties do people experience when preparing herbal tea at home?

AI role: Clarifier

What are the scientifically validated optimal brewing temperatures and steeping times for common herbal infusions?

AI role: Expander

How can herbal teas be classified into evidence-based functional segments ?

AI role: Re-framer

Do improper or incompatible herbal tea combinations reduce or amplify the intended functional effects of individual herbs?

AI role: Critique

AI Response

Users frequently experience inconsistent taste, incorrect dosage, unstable water temperature, and difficulty controlling brewing time when preparing hot beverages.

Herbal tea preparation often leads to inconsistent taste and effects because results depend on herb type, plant part, water temperature, and steeping time. Additionally, many users rely on habitual brewing rather than following preparation instructions.

Many users struggle to determine the correct herb quantity, water temperature, and steeping time when preparing herbal tea, and often do not know which herbs can be combined.

Herbal tea extraction depends on water temperature and steeping time. Most bioactive compounds are effectively extracted at 80–100 °C within 5–10 minutes, although optimal conditions may vary depending on the plant part (flower, leaf, seed, root).

Herbal teas can be categorized into functional groups such as calming, digestive, antioxidant, and caffeine-containing herbs based on their bioactive compounds and physiological effects.

Improper or incompatible herbal combinations may reduce effectiveness or amplify certain physiological effects, potentially leading to unintended outcomes.

Reflections

Insight
Users struggle to control water temperature and steeping time when preparing herbal tea.

Design response
This led to the development of a system that automatically regulates brewing temperature and steeping time.

Insight
Preparing herbal tea involves multiple variables such as herb type, plant part, temperature, and steeping time.

Design response
This led to the design of a system that simplifies the preparation process and standardizes brewing parameters.

Insight
Users are often unaware that herbs have different functional properties such as calming, digestive, antioxidant or energizing effects.

Design response
This led to the development of a application that helps users select herbs based on functional categories.

Insight
Many users are unsure which herbs can be safely combined or whether certain combinations may conflict.

Design response
This led to the decision to include an application feature that warns users when incompatible herbs are selected.

Design Decision

Rejected concepts and forms

Preset-based brewing was too rigid and did not adapt well to different herbal ingredients.

Focused mainly on dose control and did not address the full brewing process.

Form did not evoke a strong association with herbal tea preparation.

Accepted concept

A brewing system that enables precise temperature and steeping control for mixed herbal infusions.

- The containers were elevated,
- The water tank was repositioned for better visibility,
- The cup area was reshaped to improve form consistency.

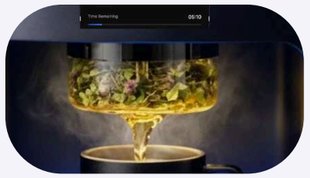
Form Process

Final Product

A Removable Water Tank
Allows users to easily refill and clean the system.

Herb Removable Containers
Separate different plant parts, enabling optimized brewing conditions for each type.

Automatic Brewing control
Regulates water temperature and steeping time to ensure consistent brewing results.



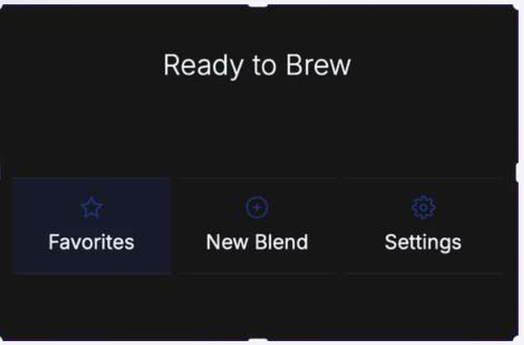
A built-in filter
the infusion outlet prevents herbal particles from entering the cup while maintaining a smooth flow.

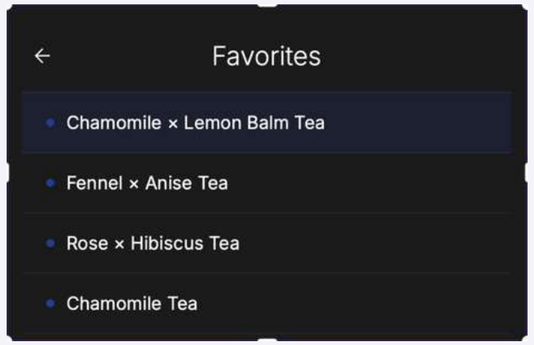
Ambient Lighting
Lighting in the water tank, cup area, and herb containers improves visibility during nights and enhances the experience

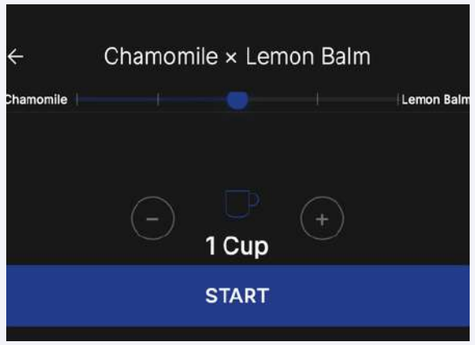
A Cup Warmer
Keeps the cup at an optimal temperature before serving

Power Button
Enables intuitive activation of the system.

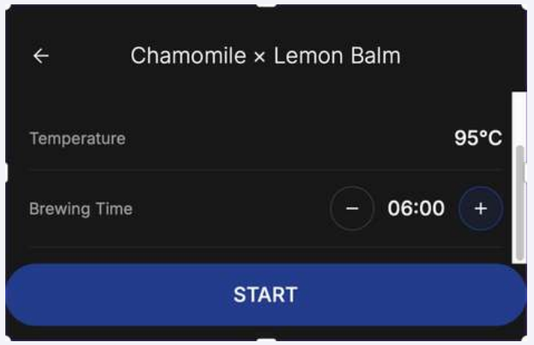
Product screen



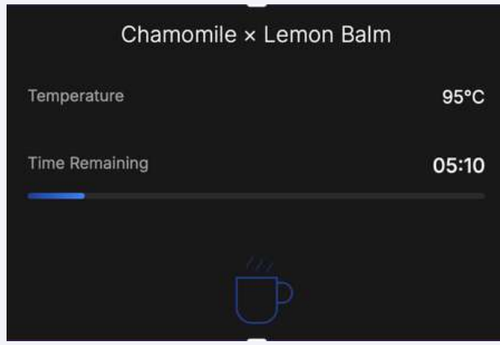


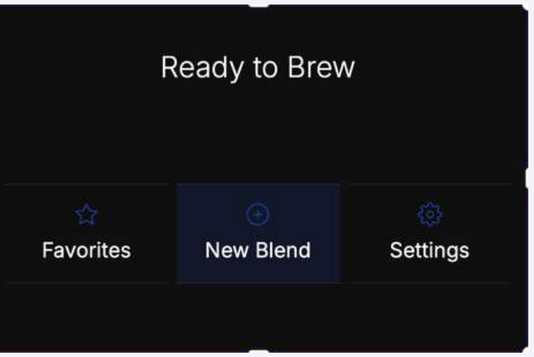


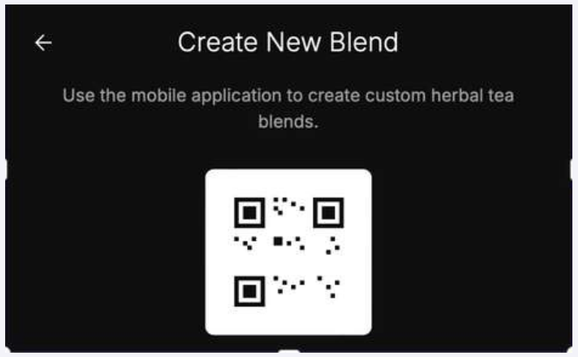
Adjust herb proportions in a blend and select the number of cups.

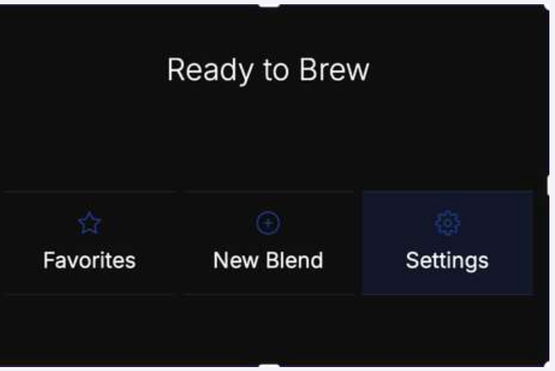


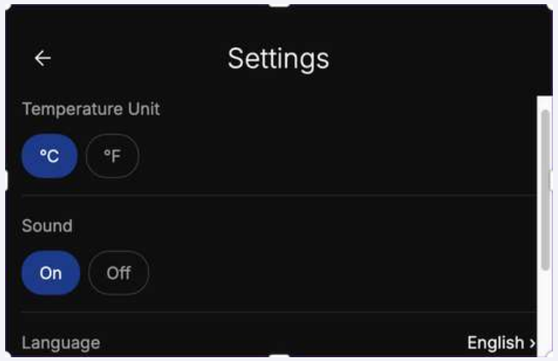
Adjust the steeping time within the recommended range.

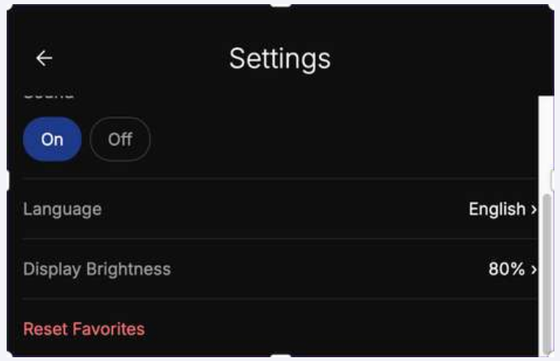




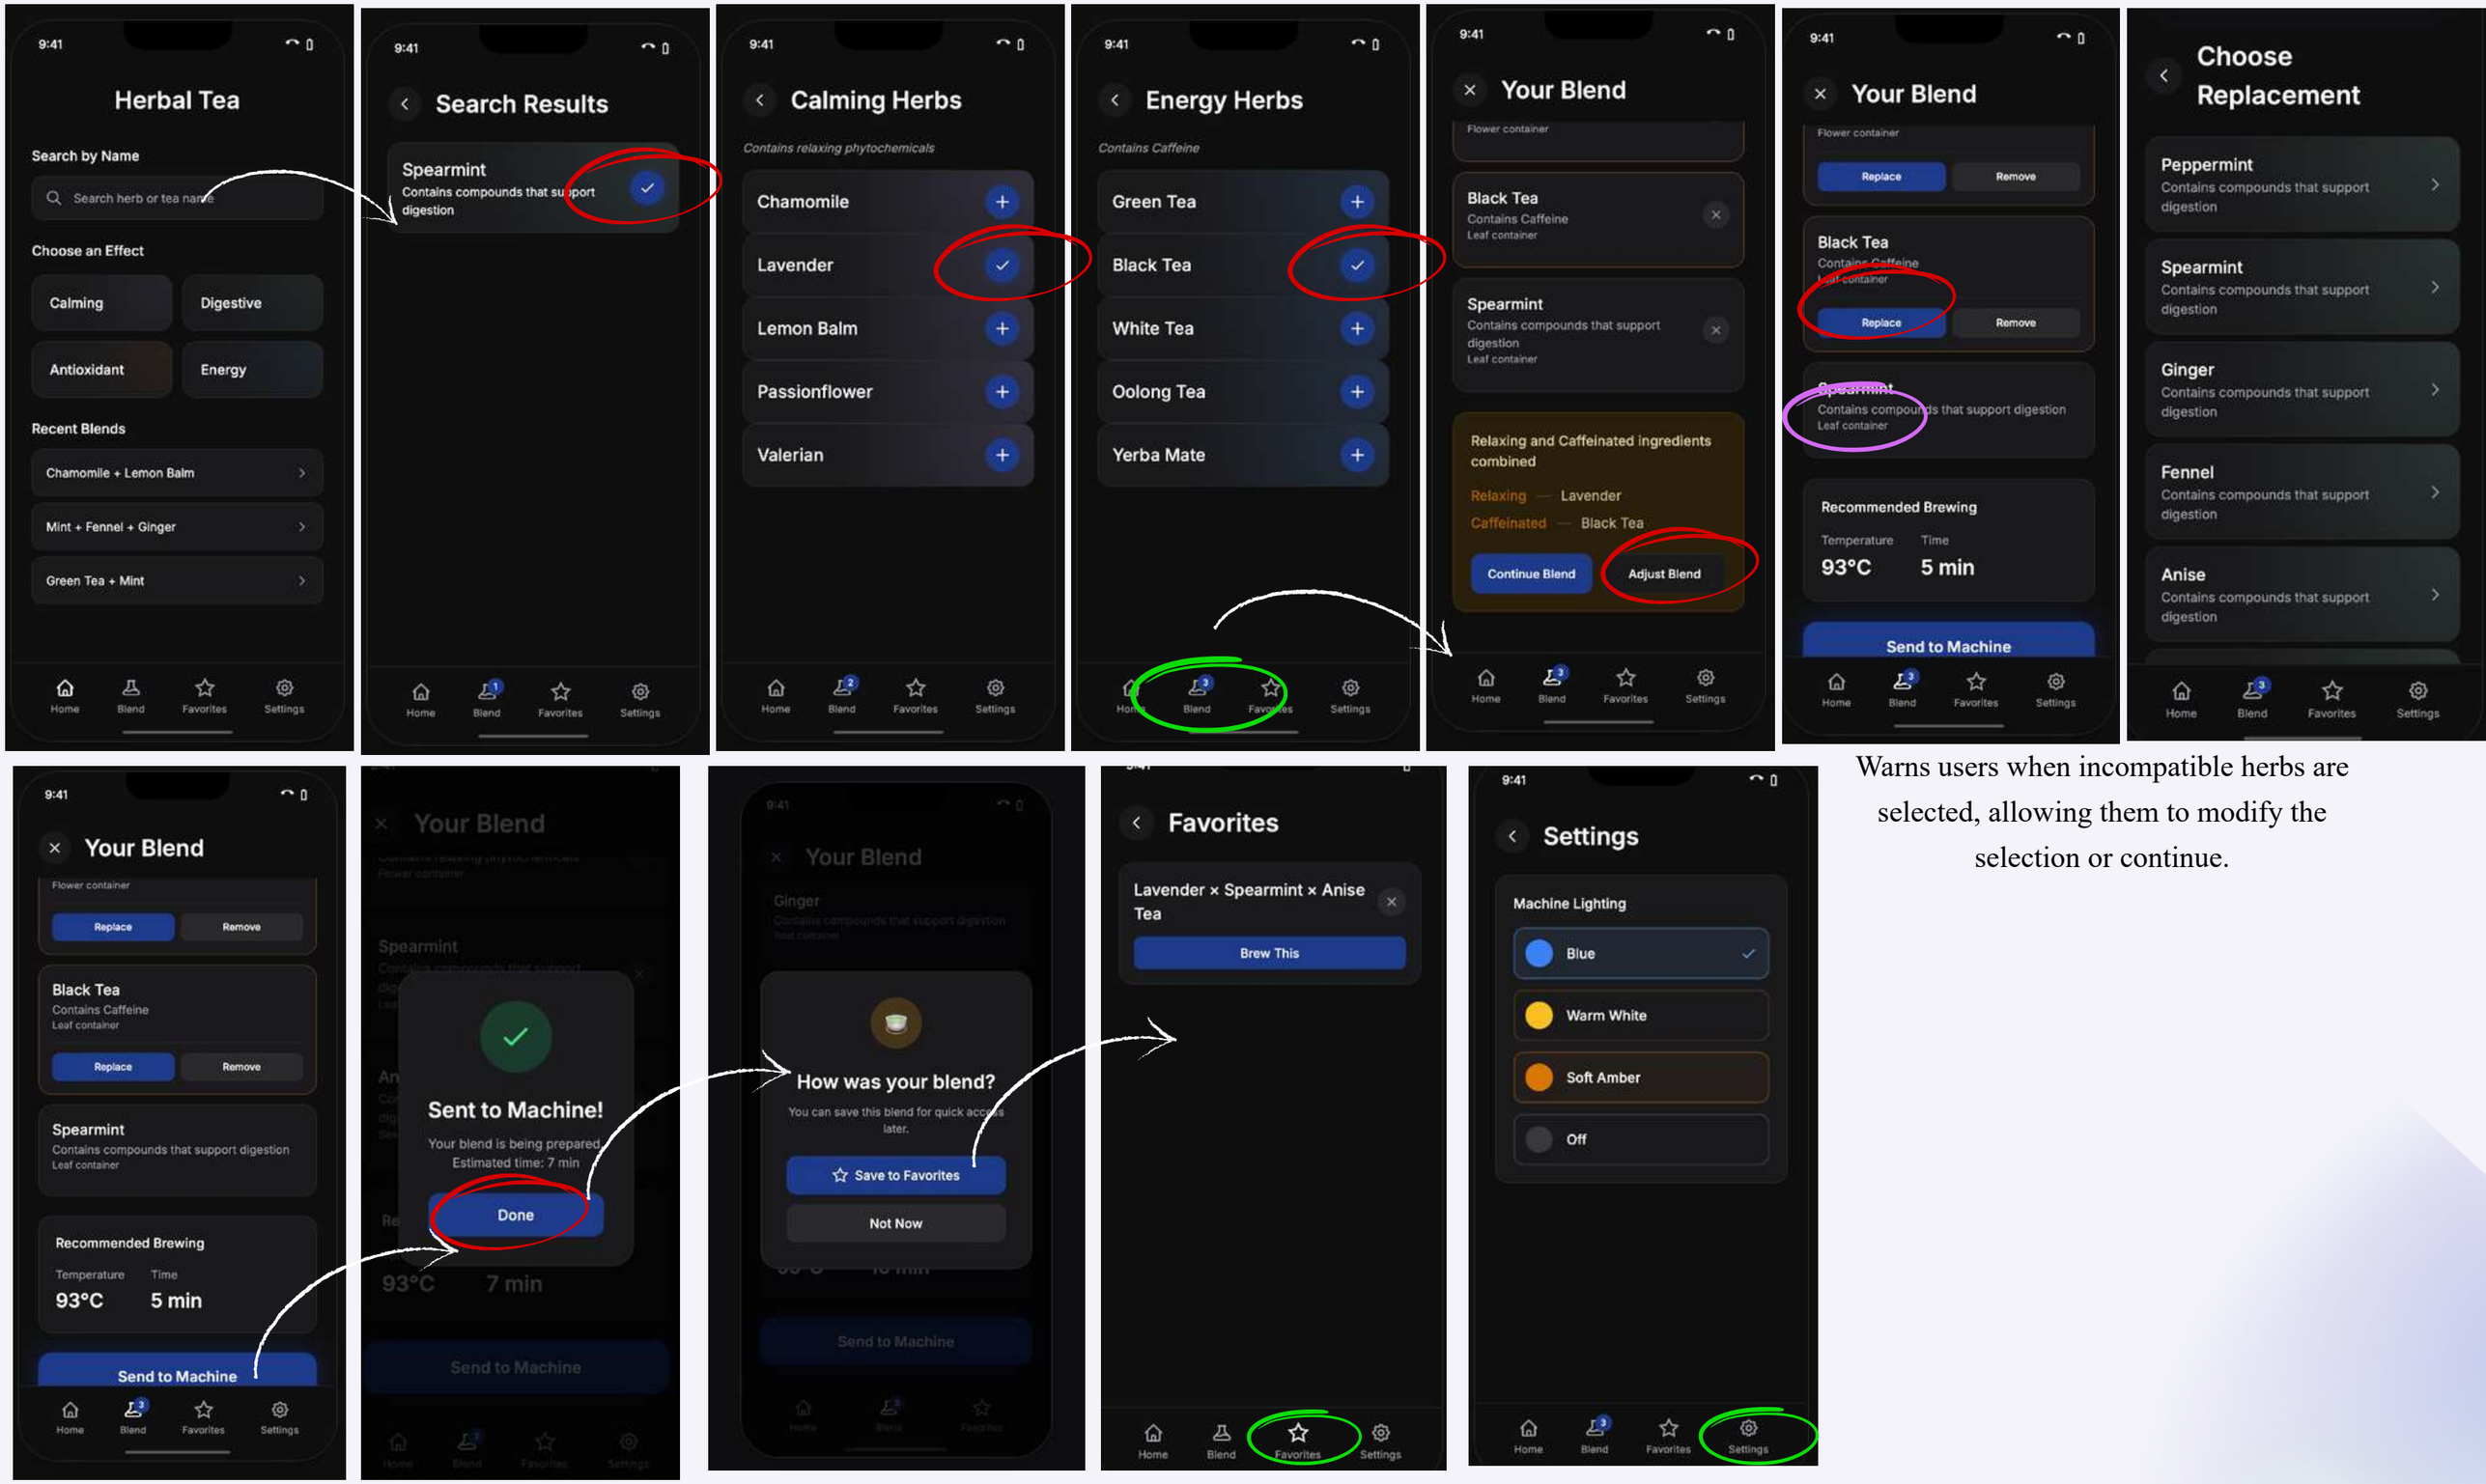








Application



Warns users when incompatible herbs are selected, allowing them to modify the selection or continue.
